

Use this short quiz to find out if your current computer system is protected from hackers, viruses, spyware, key loggers, and rootkits.

If you cannot score a “yes” on every point, your computer network could be used by hackers for credit card fraud, espionage, hacking and a wide variety of other disruptive services:

- Are your computers remotely monitored 24-7-365 to keep critical security settings, virus definitions and security patches up to date?
- Do you have written, network documentation detailing what software licenses you have, critical network passwords, and hardware information, etc., or are you the only person with the “keys to the kingdom?”
- Do you prohibit remote users from accessing your corporate data from laptops using free Wi-Fi connections?
- Do you prohibit employees from browsing the Internet on your network with a content filter that blocks sites containing porn, gambling, YouTube, etc.?
- Do you allow employees access to corporate data on their personal mobile devices, and could the data be removed if you terminated the employee?
- Do you allow employees to update your social media content and if so, do you have proper written policies on what type of content they can post?
- Do you prohibit employees from using portable devices such as USB drives to transfer corporate data according to their Acceptable Usage Policy?
- Do you prohibit employees from using BYOD without having a policy of what corporate information they are allowed to access?
- Do you require all laptops use encryption?
- Do you have a written plan in the event a laptop or PC is stolen?
- Do you have a written procedure for employee termination and how to handle removing corporate data from their personal devices?
